Cloud-to-Cloud Integration Framework

This document shows the available beta integrations. To participate contact your Sumo account executive.

See our complete and supported integrations.

The Cloud-to-Cloud Integration Framework is a fully-managed collection system that collects logs and events directly from SaaS and Cloud platforms. This data often includes custom events and user data critical for operations monitoring, security, and compliance use cases. As a fully managed collection system, integrations running within the Cloud-to-Cloud Integration Framework provide a secure endpoint to receive event data in your account. Integration authentication, scheduling, and state tracking are all managed by the framework

Limitations

- The number of Cloud-to-Cloud Sources is limited to 20.
  - You will be warned when you have 16 Sources or 80% of the limit.
  - You will be notified when you have reached the Source limit.

Integrations

The topics below are the available integrations in beta. You are invited to request new Sources for the Cloud-to-Cloud Integration Framework from our Ideas Portal.
